

All-in-One Door Access & Video Surveillance

Kisi, a cloud-based access control provider, integrates with Cisco Meraki cameras to provide visual snapshots that enhance the audit trail for admins—directly on their Kisi dashboard. Companies can use the video functionality to verify access control logs for auditing and investigations.

Purpose of Integration

Review unlock events and receive visual snapshots of which user actually went through the door at the time of an unlock event—without searching for video footage. The camera integration provides snapshots before and after unlock, forced-entry, or held-open door events.

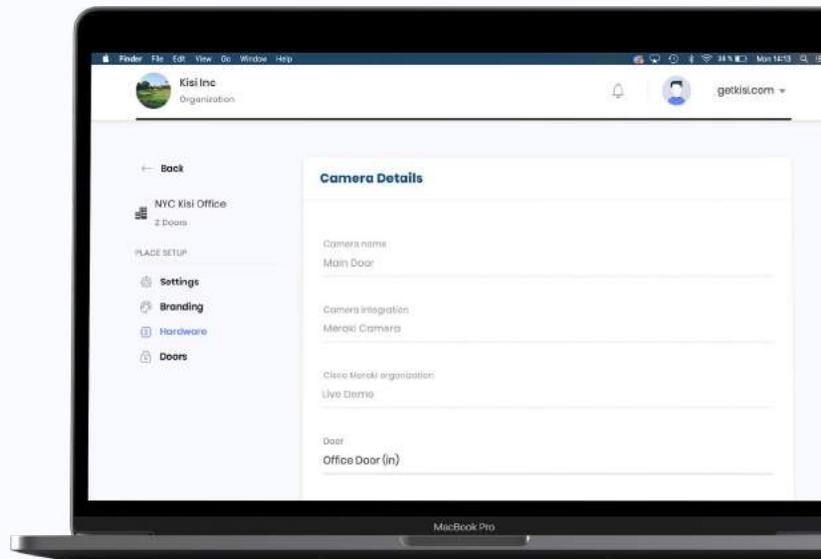

Benefits

- **Streamline activity logs** and audits with visual snapshots
- Provide **additional context** for security-related events
- **Visual feedback** to enable administrators to resolve issues
- Administrators can **assign/deassign cameras to/from doors**
- Enable your staff to **quickly validate door entry events**
- Enforce the **proper use of credentials**
- **Investigate tailgating** situations
- **Avoid having to switch** between access control and video system activity logs
- **Enable real-time intrusion alerts** for held-open and forced-open door events

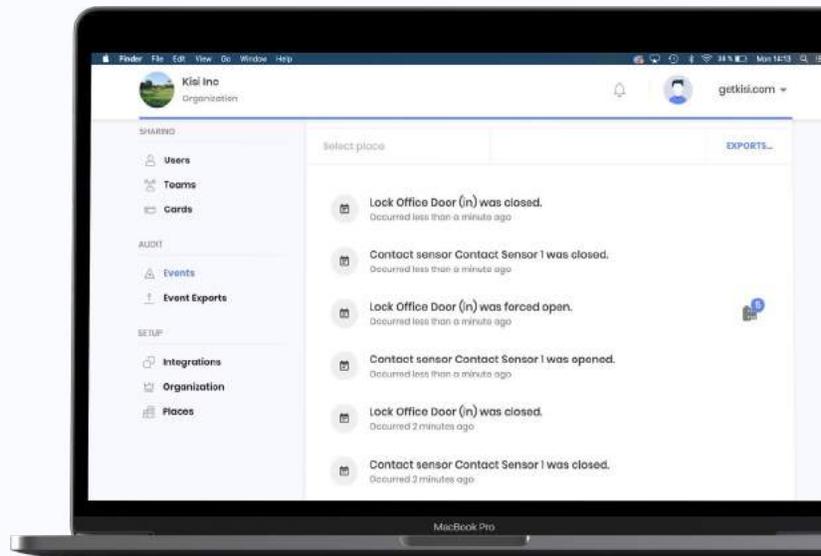

Out-of-the box setup

Admins can set up the integration in a few minutes and map specific cameras to respective doors.

Admin experience

The integration captures between five to nine visual snapshots for each door event.

Visual audit trail

Visual snapshots record unlock, held-open and forced-open door events.
