

Using Kisi in Relay-Based Elevators

Kisi now extends access control to relay-based elevators. A Kisi Reader, installed inside the elevator cabin with wired internet connection, allows a user to present their phone or keycard to the reader and press the floor button they're authenticated to access. This solution allows admins to control access to Kisi-enabled floors.

Is my elevator relay-based?

Relay-based elevators allow the user to enter the elevator and choose their floor.

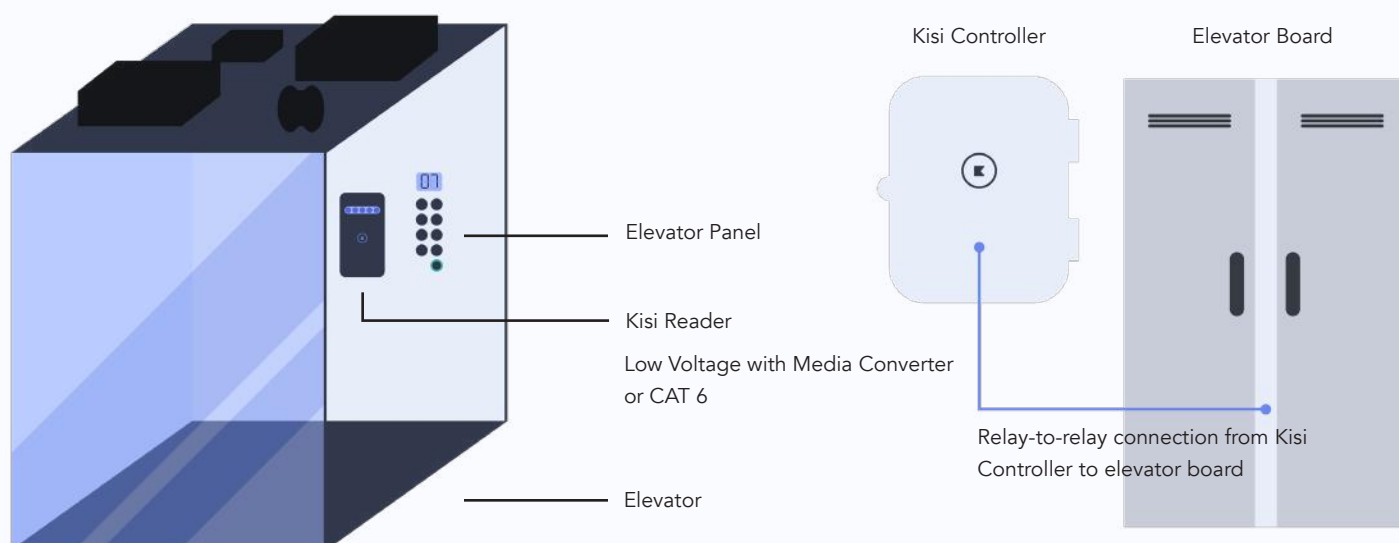

Dispatch-based elevators have a screen in the lobby where users choose their floor and board the indicated elevator. If you are looking for a dispatch-based elevator solution please speak with our sales team.

★ Features

- A Kisi reader is visibly installed in the elevator cabin and the Kisi controller is connected to the elevator board.
- Kisi enables buildings with unlimited floors
- One Kisi controller manages up to four floors (i.e. for 16 floors you will need four Kisi controllers)

Elevator Wiring

Pricing

\$30 per elevator stop (per month)
